Next Generation Communication (For the Nation)

Existing Communications

- Has an open source client (good).

- Has end to end encryption in private chats (good).

BUT…

Existing Communications

Closed source server (bad).

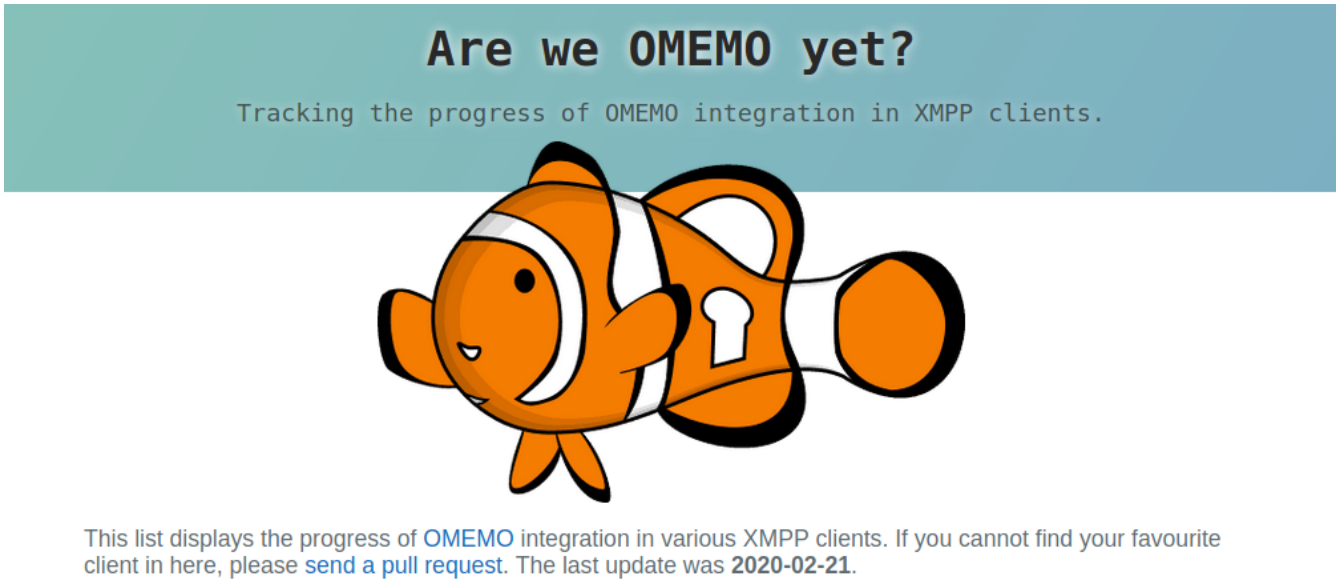
Group communications are not end-to-end encrypted (bad).

Only one service provider (bad).

Option...

(Originally known as jabber.)

But what about encryption?!



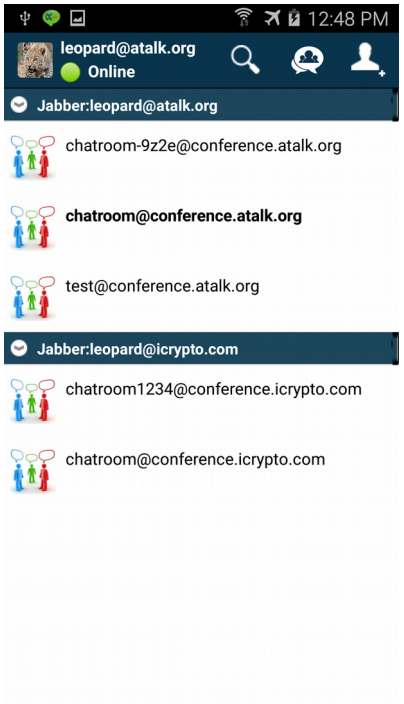
OMEMO is end-to-end encryption for XMPP/Jabber

List of XMPP clients that support OMEMO:

https://omemo.top/

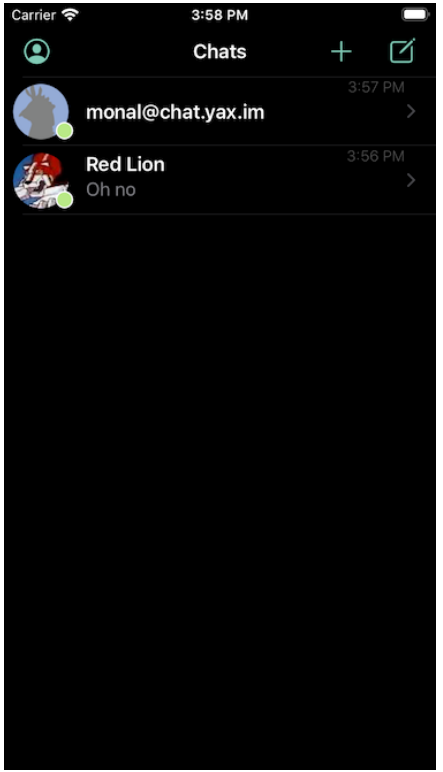
Eg.

For Android ...



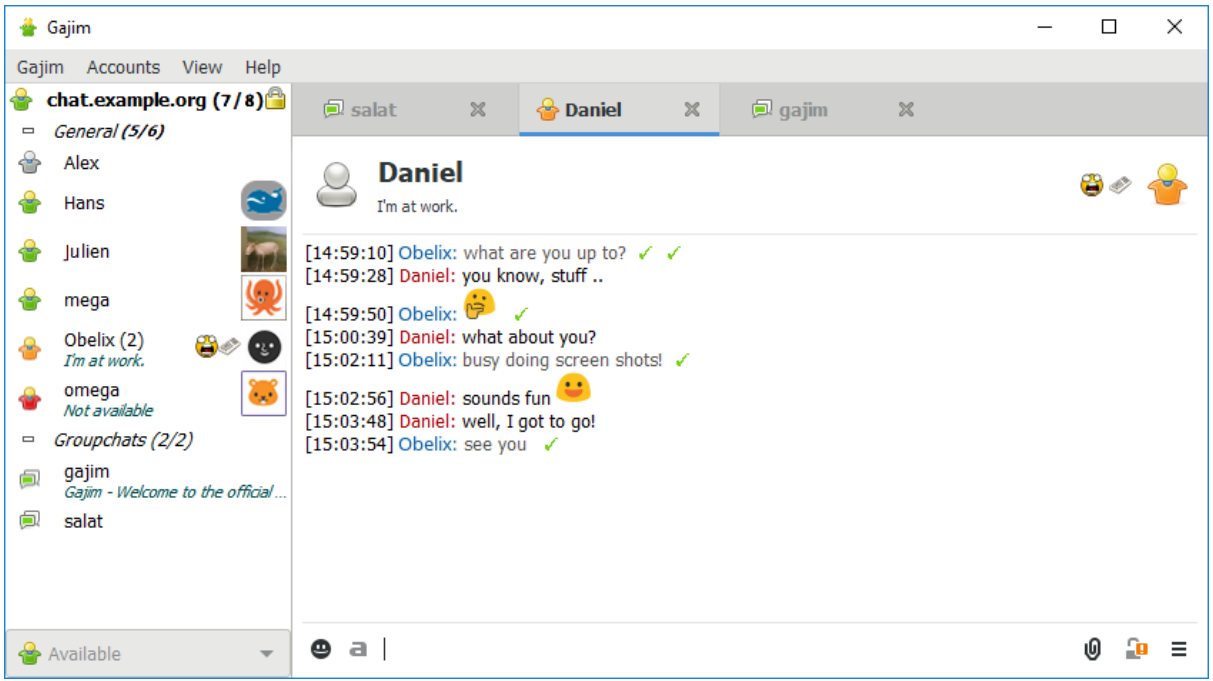
“aTalk”

For Ithing ...



“Monal”

For BSD, Linux and Windows



"Gajim"

Multiple Vendors --> GOOD

How to register?!

Somebody could set up an XMPP server, as open source XMPP servers exist, we could all then join that XMPP server.

OR

Register on one of these servers and use with the above programs:

https://list.jabber.at

Would you want to join the experiment?!

Discuss.
